# MSP-Rex

**MSP-Rex is a new power tool from Advisicon that allows advanced, highly granular filtering of multiple projects simultaneously.**

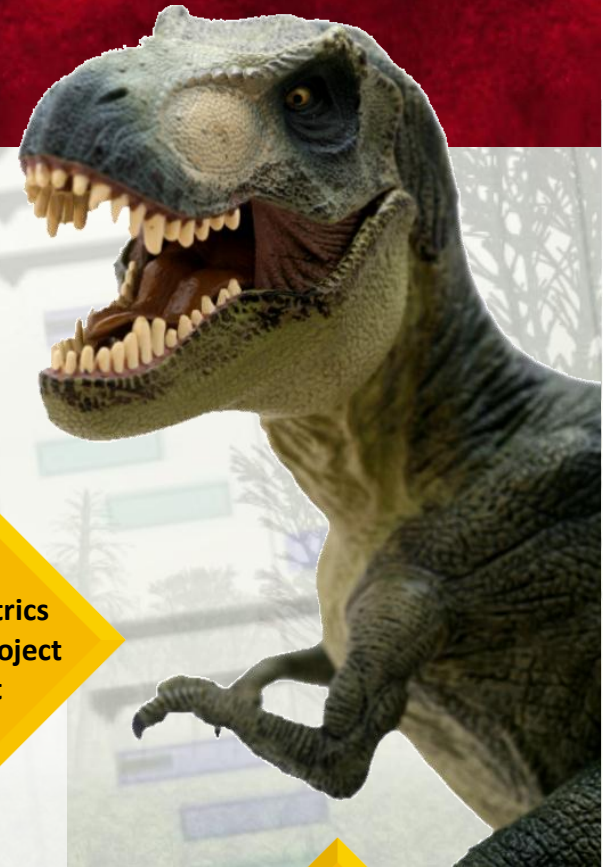

MSP-Rex provides senior management with top-down views of all project details and data right from the desktop. With MSP-Rex you can create filters that *span your entire EPM instance*. You can then apply the filters to return any project data and export to either Project or Excel. All reports and filters can be saved for future use.

Use MSP-Rex to act as an ETL (Extract, Transform, Load) tool to mine information from Project 2007/2010, where it can be dropped into Excel Services or to other reporting tools that leverage SharePoint's Business intelligence capabilities.

Program and Portfolio managers can benefit from MSP-Rex's filtering capabilities to help enforce data, quality, and process compliance through the ability to create extremely granular filters and then generate reports on the information returned.

Quickly Find Key Metrics Across Any Project In Project Server

Search & Find Data Across All Of Project Server

Project Server 2007/2010
